OWNER PROJECT DOCUMENT REVIEW CanadianSolar

REVIEWER: Mustafa Zaidi **DATE:** 20/01/2015

Review of this Detailed Engineering Design was performed in order to identify general conformance with the specifications of the Project and for Owner comment. General review and comment by the Owner shall not in any way constitute approval of the applicable document, or supersede or displace obligations of the party submitting the document for review. Review by Owner of any Detailed Engineering Designs is for general review and comment only, and shall not relieve Contractor of the sole risk and responsibility for any and all errors or omissions in such Detailed Engineering Designs or the consequences thereof, or for complying with all requirements of the EPC Agreement, Applicable Laws, and Applicable Permits. All capitalized terms herein shall have the meanings ascribed to them in the Engineering, Procurement and Construction Agreement between Kingston Solar LP (as "Owner") and Canadian Solar Solutions Inc. (as "Contractor") dated June 20, 2014 as amended.

Section 1
Introduction

H.B. White Canada has been retained by Canadian Solar to provide Engineering, Procurement, and Construction services for a 100 MWac solar energy generating facility near the City of Kingston, in Southeastern Ontario. The proposed project is divided into six zones along Unity Road, and is generally bounded by Highway 38 to the east, Mud Lake Road/County Road 19 to the West, Quabbin Road to the north, and Highway 401 to the south. The proposed project falls within two municipalities; the City of Kingston to the east and the Loyalist Township to the west.

This report has been completed to address the stormwater management requirements for the proposed project.

The following documents were reviewed prior to completing this report:

- Cataraqui Region Conservation Authority (CRCA) comments on draft documents, August 17, 2012
- Stormwater Management Plan, AMEC, September 2012
- Stormwater Management Report Loyalist Township, Dillon Consulting, December 2013
- Stormwater Management Report City of Kingston, Dillon Consulting, December 2013
- CRCA comments on the aforementioned December 2013, Stormwater Management Reports, February 5, 2014
- Stormwater Management Plan Comments from City of Kingston, February 12, 2014
- Stormwater Management Plan Comments from Township of Loyalist, February 24, 2014
- CRCA comments on Flood Plain Delineation, March 5, 2014
- CRCA comments on H.B. White Canada Corp. Stormwater Management Report, September 3, 2014
- CRCA comment letter, September 25, 2014

Section 2
Site Description

The proposed project involves multiple properties in the City of Kingston and Loyalist Township. The existing properties are composed of a mixture of vacant pastureland, cultivated farmland, wooded area, and impervious features such as building and roads. Soils at the site encountered during the geotechnical investigation were mostly silty clay or clay overlaying shallow limestone bedrock. The Ministry of Natural Resources (MNR) land information database classified the majority of site soils as Hydrologic Soil Group B.

The project area is composed of six zones, each of which are described in more detail below and can be seen on an overall site map on Sheet C101. Existing drainage area boundaries are shown on the Pre-Construction Drainage Plans (C200s, 5 sheets).

Zone 1 is the westernmost portion of the project and is composed of properties 21, 22, 23, and 24. The zone is bounded by County Road 19 to the north and Highway 401 to the south. Surface water runoff generally flows from east to west with offsite area draining through the site. This zone contains two watercourses running through the site, and a third watercourse at the southern extent of the zone. The northern portion of the zone flows towards County Road 19, while the southern portion of the zone flows towards Highway 401.

Zone 2 is located on the western portion of the entire project, and is composed of properties 19 and 20. The area is bounded by County Road 19 to the north, Howes Road to the east, and a pipeline easement to the south. Surface water runoff generally flows to the north. An existing ditch flows northwesterly through the site, carrying offsite flow through the zone. The ditch routes southwesterly before existing the zone on the west side.

Zone 3 is located central to the overall project and is composed of properties 14A, 14B, and 14C. The zone is bounded by Unity Road to the north and Smith Road to the east. Surface water runoff generally flows to the south. Offsite flow contributes to surface water runoff on the properties via cross culverts on Unity Road. This zone contains a watercourse which bisects the area. Several dugout drainage ditches and depressions are present within this area.

Zone 4 is the relative northeast portion of the project and is composed of properties 4 and 25. The zone is bounded by Unity Road to the south. Surface water runoff generally flows to the south towards Unity Road. This zone includes existing structures, dugout ponds, and drainage ditches.

Zone 5 is the northeastern most portion of the project and is composed of properties 2 and 3. The zone is bounded by Unity Road to the south. Surface water runoff generally flows to the southeast towards Rock Road. An excavated drainage feature is located near the east boundary of zone 5.

Zone 6 is the southeast portion of the project and is composed of property 12. The zone is bounded by Glenvale Creek to the north and Westbrook road at the southeast corner. Surface water runoff generally flows to the west towards Glenvale Creek. The zone is bisected by a utility easement.

All six zones of the project are generally flat, with over 25 percent of the project area between 0.0 to 0.25 percent grade, and almost 60 percent of the project area has existing ground slopes of less than 1.0 percent. Based on low infiltration rates, flat terrain, and closed depressions, areas of the site are subject to localized ponding and flooding.

Due to the site flatness, the site is at a low risk for sediment transport and erosion as runoff velocities and soil shear stresses will be low.

Section 3
Proposed Construction Conditions

As shown on the site layout sheets, the site will be constructed as a number of array blocks consisting of photovoltaic modules, racks, gravel access roads, I-houses (inverters and transformers), substation, and related electrical collection systems. The access roads are designed to provide maintenance and emergency vehicles access to the I-houses, combiner boxes, and substation. Roads will typically have swales running alongside them to convey stormwater runoff. Culverts or rock crossings will be installed as needed to convey stormwater runoff across site access roads. Gravel laydown areas will be constructed near the site substation to provide room for construction trailers and parking, and to store the modules, racks, and other solar components during construction.

Trees and brush will be removed from the site within the fence line to make room for the solar project components and reduce shading on the modules. Typical grading activities will be limited to minor smoothing of existing ground as needed for rack installation. The southeast corner of Zone 1, near MV1-13, requires grading of a hill to reduce shadows on racks. Zone 3 includes grading at two proposed locations to promote stormwater runoff; one near the watercourse to build up a low area and route stormwater runoff around access roads and I-house pads, and one located at the southeast corner to promote drainage off the site. Depressions will also be filled to help minimize ponding onsite and promote positive drainage toward site outlets.

At the completion of construction, the entire solar project area will be seeded with low-maintenance vegetation, with the exception of the gravel access roads, I-house pads, and substation pad. Swales will be grass-lined as indicated on the construction drawing details. The swales will outlet to flow spreaders to dissipate energy and diffuse concentrated flow.

Minimal alteration of existing drainage patterns will occur. Stormwater runoff will be routed as closely as possible to the existing site outlets. The anticipated post-development drainage areas are shown on the Post-Construction Drainage Plans (C201s, 5 sheets). All six zones of the project will remain generally flat, with over 25 percent of the project area having ground slopes of equal to or less than 0.25 percent, and almost 60 percent of the project area having ground slopes of less than 1.0 percent. Existing closed depressions within the project limits are planned to be filled, however, due to the existing flat terrain and the feasible accuracy of grading activities with heavy construction equipment, areas of the site will remain subject to potential localized ponding after construction.

Section 4
Stormwater Runoff Modeling

A conceptual Stormwater Management Report (SWMR) was completed by Dillon Consulting in December 2013 and submitted to the Cataraqui Region Conservation Authority (CRCA), City of Kingston, and Loyalist Township. The CRCA provided comments on the report in February 2014. In general, the methodologies of this report follow what was previously completed in the December 2013 SWMR.

Stormwater runoff was modeled by the United States Natural Resource Conservation Service's (NRCS's) Unit Hydrograph Method (SCS Method) for each drainage area using HydroCAD, a computer-aided design program for modeling hydrology and hydraulics. See Appendix A for model output.

Existing information on the physical characteristics of the site was determined and incorporated into the rainfall-runoff model to calculate the peak flow of stormwater runoff. The MOE Stormwater Management Planning and Design Manual (March 2003), herein referred to as the MOE Design Manual, and the MTO Drainage Management Manual were used as guidance for hydrologic and hydraulic design. The following inputs/assumptions were used for the stormwater runoff model:

- Drainage areas, slopes, and flow paths were determined using contour data created from LiDAR survey data, inspection of aerial photography, publically available topographic data, and guidance from the December 2013 SWMR.
- Rainfall depths (Table 1) were determined from the best fit line of the Kingston Pumping Station Short Duration Rainfall Intensity-Duration-Frequency (IDF) curve from the Atmospheric Environment Services.

Table 1. Kingston Pumping Station Rainfall Depths

Recurrence Interval	12-Hour (mm)	24-Hour (mm)
2-Year Storm	42	55
5-Year Storm	55	70
100-Year Storm	93	120

- Time of Concentration (Tc) values were calculated using the FAA Airport Method for overland flow and Manning's equation for channel flow, as described below.
  - Airport Method (Overland Flow)

    $T_{c1} = (3.26 * (1.1 - C) * L^{0.5})/S_w^{0.33}$ Where: C = Runoff Coefficient
    L = Watershed Length (m)
    S_w = Watershed Slope (%)
  - Manning's equation (Channel flow)

    $T_{c2} = L/(60*V)$, where $V = (R^{2/3} * s^{1/2}) / n$ V = Average Velocity (m/s)
    Where: n = Manning's roughness coefficient (0.030 for grass-lined swales)
    R = Hydraulic Radius (m)
  - Total time of concentration

    $T_c = T_{c1} + T_{c2}$
- The antecedent moisture constant (AMC) was assumed to be 2, normal conditions.
- Hydrologic Soil Group B (loamy soils overlaying bedrock or clay subsoil) was selected based on the MNR land information database and onsite geotechnical investigation boring logs from AMEC's October 2011 Geotechnical Investigation Report.
- The curve number (CN) (Table 2) is a primary input for the SCS Method and the values were obtained from Design Chart 1.09 of the MTO Drainage Management Manual. Weighted CN values were calculated to represent the land cover makeup of each drainage area and are included as part of Tables 3 and 5.
- Runoff coefficients (C) (Table 2) were used to calculate Time of Concentration and were obtained from MTO Design Chart 1.07. Weighted runoff coefficients were calculated to characterize the land cover of each drainage basin and are included as part of Tables 3 and 5. Per the MTO Manual, the 100-year storm runoff coefficients were increased by 25%, up to 1.00, for each land cover type.
- PV modules are not considered impervious area because they will be suspended above the ground, allowing vegetation to grow beneath them and water to infiltrate. Stormwater will flow from the modules onto the grassed areas below, allowing these areas to remain available for runoff infiltration and conveyance. The foundation posts for the racking system, consisting of a total of 51,616 posts equaling 654m^2, are negligible in terms of area of imperviousness. Based on a total project area of 288.8 hectares, the foundation posts account for 0.018% of project area, and do not influence the post-development curve number conditions.

Table 2. Site Runoff Coefficients and Curve Numbers

Land Use or Surface	Project Property Component	CN	2- and 5-Year C	100-Year C
Paved	Buildings, inverter stations	98	0.95	1.00
Gravel	New access roads, substation pad	89	0.60	0.75
Agricultural	Existing agricultural areas	74	0.35	0.44
Woodlots, Forest	Existing wooded areas, heavily covered shrub areas	58	0.25	0.31
Waterbodies	Existing open water/wetlands	98	0.95	1.00
Pasture	Existing grassed land, Post-construction solar array area	65	0.28	0.35

Tables 3 and 5 provide a summary of the drainage areas for the pre- and post-development weighted runoff coefficients and curve numbers. Tables 4 and 6 provide a summary of the flow paths for the pre- and post-development conditions. Tables 7-10 provide a summary of the peak flows for each recurrence interval and design storm. Refer to Appendix A for detailed modeling results.

The land cover alteration resulting from the conversion of existing cultivated farmland and woodland into grassed area results in a design curve number change. In general, the conversion of cultivated farmland offset the removal of woodlands and the addition of gravel access roads and I-house structures. Overall, post-construction peak flow rates decreased or resulted in a negligible increase that would not cause negative downstream impacts. As a result, quantity control is not required for the developed site.

Section 5
Stormwater Management Plan

The site stormwater runoff will be managed through the use of drainage swales, rock crossings, and culverts to route stormwater through the site. Areas of concentrated flow will be dispersed with flow spreaders to facilitate sheet flow characteristics prior to leaving the project boundary. Final grading and restoration of the site will be performed such that the ground will be sloped away from buildings, roads, substation, and I-houses.

Swales

Swales will convey stormwater runoff through the site along the access roads and through the solar panel racks. Refer to the Site Grading Plans (C400s) for swale locations. Swales were sized using Manning's equation (as described in Section 4) to convey the SCS Type II 5-year, 24-hour peak flow rate without overtopping site access roads. Swale sizes vary throughout the site due to varying natural topography, but typical swales are 0.3m bottom width, 0.3m deep with 3:1 side slopes. Refer to Appendix D for swale sizing calculations. To convey offsite flows and larger onsite flows, some non-typical sized swales were designed. The swale in the Northwest corner of Zone 2 (Drainage Area Z2-B1.1) was sized with a 0.5m bottom width, 0.35m depth and 5:1 side slopes. Similarly, to convey larger design flows, Zone 3 swales vary in size from 0.3m to 0.75m bottom width, 0.3m to 0.4m deep, and either 3:1 or 5:1 side slopes. Zone 5 swales range in depth from 0.3-0.35m, with a 0.3m bottom width, and 3:1 side slopes. Refer to the Site Grading Plans for specific swale locations.

Culverts

Culverts will convey stormwater runoff under site access roads. Refer to the Site Grading Plans (C400s) for culvert locations. Culvert sizing calculations were performed using HY-8 software developed by the United States Federal Highway Administration (FHWA). Culverts are made of corrugated steel pipe (CSP). Culverts at CRCA regulated crossing locations were evaluated for the SCS Type II 2- and 100-year, 24-hour peak flow rates. Access road entrance culverts and interior culverts were sized to pass the 5-year, 24-hour storm event without overtopping site access roads, with the exception of culverts C2.1 and C2.3 in Zone 2 which were sized similar to the CRCA crossing culverts. See Appendix B for detailed output. Culvert sizes and lengths are provided below in Table 11.

Table 11. Project Culverts

Table 11. Project Culverts (Continued)

Culvert ID	Design Flow (m^3/s)	Pipe Diameter (mm)	Number of Barrels	Length (m)
C6.1	0.07	600	1	20
C6.2	0.05	300	1	10
C6.3	0.01	300	1	8
C6.4	0.05	300	1	10

Rock Crossings

In locations where it is impractical to install culverts, rock crossings will be installed to convey stormwater across site access roads. The rock crossings are depressed, reinforced road sections designed to allow flow over the access road. Proposed rock crossing locations are shown on the Site Grading Plans. Typical rock crossing sizing is provided on Detail Sheet C500. Rock crossings were sized for the 5-year storm using Manning's equation (as described in Section 4). Rock crossings were checked for both conveyance capacity and erosion potential. Rock crossings have conveyance capacity for a minimum 0.1% slope, and design shear stresses are under permissible levels for the specified lining material.

Outlet Protection

Riprap apron flow spreaders will be installed at the outlets of culverts, rock crossings, and where concentrated flow exits the site, as shown on the Site Grading Plans. The flow spreaders will dissipate energy and reduce velocity to help minimize erosion. They will also disperse the concentrated flow to emulate pre-development sheet/shallow concentrated flow conditions.

Flow spreaders were designed using guidance from the US Department of Transportation Federal Highway Administration document, "Hydraulic Design of Energy Dissipaters for Culverts and Channels". Sizing was completed for the SCS 5-year, 24-hour peak flow rate. Riprap D50 for all flow spreaders is 150 mm. Refer to Table 12 for flow spreader sizing.

Table 12. Flow Spreader Sizing

Culvert Diameter D (mm)	Design Flow (m^3/s)	Tailwater Depth (m)	Outlet Velocity (m/s)	Apron Length L (m)	Apron Top Width W1 (m)	Apron Bottom Width W2 (m)	Apron Depth D1 (m)
300	0.06	0.21	1.21	3.0	1.0	3.0	0.5

Triple 500	0.59	0.17	1.59	3.0	3.5	5.5	0.5
Swale/Rock Crossing Outlets	0.17	0.18	0.66	3.0	Match swale width	Top width + 2.0m	0.5

Buffer Strips

The project maintains a 30m offset from adjacent watercourses, wetlands, and woodlands. This offset will provide a natural buffer strip between the proposed development and natural features. The buffer strips are gently sloping, heavily vegetated areas that will assist in treating runoff from the site.

Section 6
Erosion and Sediment Control

To control stormwater runoff quality during construction, best management practices (BMPs) shall be used to minimize soil erosion and to provide a means for trapping sediment leaving the site. Installation of temporary measures for control of erosion and sediment shall be completed prior to the commencement of construction activities. Refer to the construction schedule on Sheet C500. The specific controls for each construction activity are based on expected construction conditions and methods.

It is understood that changes occur throughout the duration of a construction project. Therefore, the BMP locations are intended as guidelines and the location and installation of alternative BMPs should be considered as construction progresses. Weekly inspections shall be conducted and documented on the Stormwater Site Inspection Log (Appendix C). Site BMPs are detailed on Sheets C500 and C501, and are further discussed below.

Temporary (Construction Phase) Control Measures

- Temporary silt fence (heavy duty per OPSD 219.130) shall be placed at the downslope side of grading activities, stockpile areas, and the site limits, as needed.
- An additional row of silt fence may be installed at the site outlets and rock crossings.
- If necessary, an additional row of silt fence shall be installed during grading and clearing activities to provide an extra layer of protection to the adjacent watercourses and waterbodies.
- A temporary construction entrance (mud mat) shall be installed at all vehicle access points adjacent to paved roads to reduce the amount of materials that may be transported off the site.
- Phase construction, where possible, to limit the amount of time soils are exposed.
- If groundwater is encountered during excavating, divert water into a dewatering trap on well vegetated land a minimum of 30 meters from any sensitive receiving body with a silt sock on the discharge of the hose and in accordance with local guidelines and regulations. If dewatering is necessary, pumping will be limited to less than 50,000 liters per day.
- Culverts, where possible, shall be installed during dry conditions. If there is flow during the installation period, flow isolation measures, such as coffer dams, shall be implemented to allow for the area to be dewatered. If dust conditions are prevalent, use water on exposed earth areas, access roads, and work/laydown areas as necessary to reduce the movement of wind-born sediment.

- All disturbed areas left inactive for 30 days shall be adequately stabilized by seeding, mulching or other equivalent control measures.
- Built up sediment shall be removed and disposed off-site or to an approved location onsite once sediment accumulates to one-half the height of the structure, or more frequently as directed by the engineer or as recommended based on the weekly inspection.
- During construction, BMPs shall be inspected at least once per week, in advance of predicated large precipitation events, and after each precipitation event of 10 mm or greater, with repairs being made as necessary. Refer to Appendix C for the inspection log form.

Permanent Control Measures

- Riprap outlet protection shall be installed at all culverts and rock crossings as shown on the design drawings.
- Flow spreaders shall be installed where swale flows exit the site, as shown on the design drawings.
- All disturbed areas shall be stabilized with gravel or permanent seeding upon completion of the work.

Water Quality

The site will employ BMPs to reduce erosion and control sediment runoff. Site swales commonly have slopes under one percent, which results in low potential for sediment transport. Riprap or erosion control matting will be installed in areas prone to erosion. Flow spreaders are planned at culvert outlets and at locations where concentrated flows leave the site.

Silt fence will be installed as perimeter control on all downslope sides of disturbed areas. A 30 meter buffer is also maintained from adjacent wetlands and watercourses and provides a natural vegetated buffer.

Section 7
Stormwater Facility Maintenance

During construction, the site shall be maintained in good working condition. Vehicle refueling shall occur in designated locations in the laydown area. Construction waste and deleterious material shall be stored in designated locations in the laydown area.

The operation and maintenance of stormwater facilities is critical to the successful containment of sediment and stormwater. Inspections shall be performed after every significant storm event during the first two years and twice a year thereafter if there are no reoccurring problems. Specific items to be included in these inspections are as follows:

- Culvert components shall be inspected for clogging and excessive debris and sediment accumulation. Such components include pipes, riprap aprons, and inflow and outflow openings. Sediment removal shall take place when the area is thoroughly dry. Disposal of debris, trash, sediment, and other waste material shall be done at suitable disposal/recycling sites and in compliance with all applicable local, provincial, and federal waste regulations.
- Mowing and/or trimming of the vegetation in the swales shall be performed as needed to ensure it does not impede channel flow. It is recommended that grasses be cut to a minimum height of 75 mm, and not be allowed to grow higher than 600 mm. Clippings will be disposed of upland and not within 3 meters of the swales themselves.
- All structural components shall be inspected for cracking, erosion, and deterioration at least annually.

RE: SOL-LUCE KINGSTON SOLAR PV ENERGY PROJECT REA AMENDMENT

Dear Resident:

As you may be aware, Kingston Solar LP is proposing to develop, construct and operate the Sol-Luce Kingston Solar PV Energy Project, with a nameplate capacity of 100 MW AC. A Renewable Energy Approval (REA) application was submitted for this project in September 2012. The REA application was subsequently amended during the MOECC's technical review to accommodate visual and landscape setback requirements from the City of Kingston and Loyalist Township. The application was re-submitted to the MOECC in January of 2014.

A REA was granted by the Ministry of the Environment (MOE) on April 2, 2014 (REA Number: **1016-97YHC7**).

This letter provides an overview of technical changes proposed for the Sol-Luce Kingston Solar PV Energy Project. The basis for this technical change amendment comes from a requirement from Hydro One Networks Inc. (HONI) to include two DSTATCOM units, two fixed reactor banks and one neutral ground reactor. In addition, the availability of more efficient equipment has allowed for the reduction of the number of MV Stations and a decrease in the size of the project location. As a consequence, Kingston Solar LP has proposed some technical changes to the REA.

The project modifications incorporated in this amendment include: the addition of two (2) DSTATCOM units and two (2) supporting fixed reactor banks, the addition of one (1) Neutral Ground Reactor (NGR), and changes to the site layout, including the elimination of 12 Medium Voltage Power Platforms (MVPP), for a total reduction from 78 MV Stations to 66. As a result of engineering improvements there is a reduction in the number of MVPPs and the overall footprint of the project location has decreased. For clarity, all project components remain within the originally permitted REA boundary.

The report titled *Modifications Document to REA#1016-97YHC7* describes the amendments proposed by Kingston Solar LP. The report concludes that the proposed amendments represent improvements for neighbouring residents and the environment. The report is available for public viewing at http://www.samsungrenewableenergy.ca/kingston.

Kingston Solar LP is committed to ongoing consultation. If you have any questions or concerns about the project or the attached notice, please do not hesitate to contact me.

Sincerely,

David Oxtoby

Attachments: Notice of REA Amendment

NOTICE OF A PROPOSED CHANGE TO AN APPROVED RENEWABLE ENERGY PROJECT

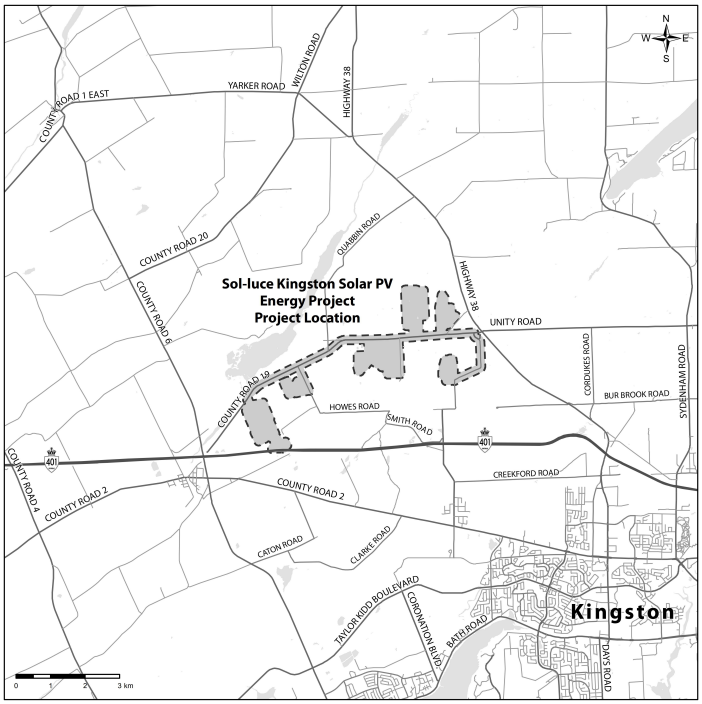
OPA Reference Number: F-002455-SPV-KC1-506

Project Name: Sol-Luce Kingston Solar PV Energy Project
Project Location: City of Kingston / Loyalist Township, Ontario
Dated at: 4th day of June, 2015

Kingston Solar LP was issued a Renewable Energy Approval on April 2, 2014 in respect of the Sol-Luce Kingston Solar PV Energy Project. Information with respect to the decision on this project can be viewed on the Environmental Registry by searching 011-8260. Kingston Solar LP is proposing to make a change to the project and the project itself is subject to the provisions of the *Environmental Protection Act*, Part V.0.1 and Ontario Regulation 359/09. This notice is being distributed to make the public aware of a proposed change to the project.

Project Description and Proposed Change:

Kingston Solar LP is seeking a technical change amendment to the REA issued for the Sol-Luce Kingston Solar PV Energy Project (REA # 1016-97YHC7). An application has been made to the Ministry of the Environment and Climate Change to change the project and alter the terms and conditions of the existing Renewable Energy Approval. The proposed changes consist of technical changes that have been required by the Independent Electricity System Operator (IESO) and Hydro One Networks Inc. (HONI). The proposed changes also reflect the final design of the facility. The changes specifically include the addition of two (2) DSTATCOM units (a 10 MVAR and a 8.75 MVAR), addition of a Neutral Grounding Reactor (NGR), and a reduction in the total number of Medium Voltage Power Platforms (MVPPs) from 78 to 66. As a result of the reduction of MVPPs, the footprint of the project location has decreased. For clarity, all project components remain within the permitted REA boundary. If approved with this change, this facility would have a total nameplate capacity of 100 MW. The project location, taking the proposed changes into account, is described in the map provided.



Documents for Public Inspection:

These changes are described in the Modifications Document for this project. The Modifications Document is titled *Sol-Luce Kingston Solar PV Energy Project Final Design Amendment Report*, and it describes in detail the technical changes proposed. The report concludes that the amendments represent improvements to the project design in terms of its interaction with the electricity grid, and will not cause any adverse environmental effects not previously considered and mitigated as part of the original REA application. This report is available for viewing online at: http://www.samsungrenewableenergy.ca/kingston.
